

Across sixteen styles, Labil Grotesk walks a fine line between orderly and outright comical. The juxtaposition of the balance inherent in sans-serif letterforms and the notion of text being affected by the laws of gravity is a central theme of KOMETA's debut release.

Mixing formal cues from the archetypal Swiss grotesques with intentionally lopsided features renders the text seemingly succumbing to its own weight; with letters looking like real objects—falling down or leaning against each other.

In physics, gravity (from Latin *gravitas* 'weight'), also known as gravitation or a gravitational interaction, is a fundamental interaction, which may be described as the force that draws material objects towards each other. *The gravitational attraction between clouds of primordial hydrogen and clumps of dark matter in the early universe caused the hydrogen gas to coalesce, eventually condensing*

The position of a particle is defined as the coordinate vector from the origin of a coordinate frame to the particle. *For example, consider a tower 50 m south from your home, where the coordinate frame is centered at your home, such that east is in the direction of the x-axis and north is in the direction of the y-axis, then the coordinate vector to the base of the tower is $r = (0 \text{ m}, -50 \text{ m}, 0 \text{ m})$. If the*

History following construction. *Between 1589 and 1592, Galileo Galilei, who lived in Pisa at the time, is said to have dropped two cannonballs of different masses from the tower to demonstrate that their speed of descent was independent of their mass, in keeping with the scientific law of free fall.* The primary source for this is the biography *Racconto storico della vita di Galileo Galilei* (Historical Account of the Life of Galileo Galilei), written by Galileo’s pupil and secretary Vincenzo Viviani in 1654, but only published in 1717, long after his death. *During World War II, the Allies suspected*

In coordinate-free terms, the gradient of a function $f(r)$ may be defined by: $df = \nabla f \cdot dr$ where df is the total infinitesimal change in f for an infinitesimal displacement dr , and is seen to be maximal when dr is in the direction of the gradient ∇f . The nabla symbol written as an upside-down triangle and pronounced "del", denotes the vector differential operator. When a coordinate system is used in which the basis vectors are not functions of position, the gradient is given by the vector whose components are the partial derivatives of f at p . That is, for $f: \mathbb{R}^n \rightarrow \mathbb{R}$, its gradient $\nabla f: \mathbb{R}^n \rightarrow \mathbb{R}^n$ is defined at the point $p = (x_1, \dots, x_n)$ in n -

The magnitude of the position vector $|r|$ gives the distance between the point r and the origin. $|r| = \sqrt{x^2 + y^2 + z^2}$. The direction cosines of the position vector provide a quantitative measure of direction. *In general, an object's position vector will depend on the frame of reference; different frames will lead to different values for the position vector.* The trajectory of a particle is a vector function of time, $r(t)$, which defines the curve traced by the moving particle, given by $r(t) = x(t)\hat{x} + y(t)\hat{y} + z(t)\hat{z}$, where $x(t)$, $y(t)$, and $z(t)$ describe each coordinate of the particle's

Structural Vibration: Stress enacted on the hull of the spacecraft results in the spacecraft bending, causing apparent acceleration. Weightlessness at the center of a planet. If an object were to travel to the center of a spherical planet unimpeded by the planet's materials, it would achieve a state of weightlessness upon arriving at the center of the planet's core. This is because the mass of the surrounding planet is exerting an equal gravitational pull in all directions from the center, canceling out the pull of any one direction, establishing a space with no gravitational pull. Absence of gravity. A "stationary"
